Supplementary Material: Complete Model Performance Results

I. Complete Model Configurations and Test Performance Evaluation Results

This supplementary material presents two sets of experimental results: (1) the average performance of 120 model configurations ranked by validation F1 score, each averaged over five random seeds, and (2) the complete set of 600 individual results from 120 models × 5 seeds. To facilitate model selection for real-world (held-out) data, the models are ranked by their test set performance in descending order. Due to space constraints in the main paper, the full results are provided here across multiple tables.

TABLE I
