Supplementary Material: Complete Model Performance Results

I. COMPLETE MODEL CONFIGURATIONS AND TEST PERFORMANCE EVALUATION RESULTS

This supplementary material presents two sets of experimental results: (1) the average performance of 120 model configurations ranked by validation F1 score, each averaged over five random seeds, and (2) the complete set of 600 individual results from 120 models \times 5 seeds. To facilitate model selection for real-world (held-out) data, the models are ranked by their test set performance in descending order. Due to space constraints in the main paper, the full results are provided here across multiple tables.
